Wiederholung

λ -Terme

Ein Term im λ -Kalkül hat eine der drei folgenden Formen:

Notation	Besteht aus	Bezeichnung
X	x : Variablenname	Variable
$\lambda p.b$	p : Variablenname	Abstraktion
	$b:\lambda$ -Term	
f a	f , a : λ -Terme	Funktionsanwendung

• "λ-Term ": rekursive Datenstruktur

Begriffe im λ -Kalkül

Begriff	Formel	Bedeutung
lpha-Äquivalenz	$t_1 \stackrel{lpha}{=} t_2$	t_1 , t_2 sind gleicher
		Struktur
η -Äquivalenz	$\lambda x.f \ x \stackrel{\eta}{=} f$	"Unterversorgung"
Freie Variablen	$fv(\lambda p.b) = b$	Menge der nicht durch
		λ s gebundenen Varia-
		blen
Substitution	$(\lambda p.b)[b \rightarrow c] = \lambda p.c$	Ersetzung nicht-freier
		Variablen
Redex	(λp.b) t	"Reducible expression"
β -Reduktion	$(\lambda p.b) \ t \Rightarrow b [p \rightarrow t]$	"Funktionsanwendung"

Church-Zahlen im λ -Kalkül

Peano-Axiome

- 1. Die 0 ist Teil der natürlichen Zahlen
- 2. Wenn n Teil der natürlichen Zahlen ist, ist auch s(n) = n + 1 Teil der natürlichen Zahlen

Church-Zahlen

- ullet "Zahlen" im λ -Kalkül werden durch Funktionen in Normalform dargestellt
- n f x = f n-mal angewendet auf x
- Bspw. $(3 g y) = g (g (g y)) = g^3 y$ Mit $3 = \lambda f.\lambda x.f (f (f x))$
- ullet Schreibt eine λ -Funktion succ, die eine Church-Zahl nimmt und zu deren Nachfolger auswertet
